1.

Consider the `mtcars` data set. Fit a model with `mpg` as the outcome that includes number of cylinders as a factor variable and weight as confounder. Give the adjusted estimate for the expected change in `mpg` comparing 8 cylinders to 4.

☐ -3.206

☒ -6.071

Correct

```
1 fit <- lm(mpg ~ factor(cyl) + wt, data = mtcars)
2 summary(fit)$coef
```

	##	Estimate	Std. Error	t value	Pr(> t)
1	## (Intercept)	33.991	1.8878	18.006	6.257e-17
2	## factor(cyl)6	-4.256	1.3861	-3.070	4.718e-03
3	## factor(cyl)8	-6.071	1.6523	-3.674	9.992e-04
4	## wt	-3.206	0.7539	-4.252	2.130e-04

☐ -4.256

☐ 33.991

points

2.

Consider the `mtcars` data set. Fit a model with `mpg` as the outcome that includes number of cylinders as a factor variable and weight as a possible confounding variable. Compare the effect of 8 versus 4 cylinders on `mpg` for the adjusted and unadjusted by weight models. Here, adjusted means including the weight variable as a term in the regression model and unadjusted means the model without weight included. What can be said about the effect comparing 8 and 4 cylinders after looking at models with and without weight included?

- ☐ Holding weight constant, cylinder appears to have more of an impact on `mpg` than if weight is disregarded.
- ☐ Within a given weight, 8 cylinder vehicles have an expected 12 `mpg` drop in fuel efficiency.
- ☐ Including or excluding weight does not appear to change anything regarding the estimated impact of number of cylinders on `mpg`.
- ☒ Holding weight constant, cylinder appears to have less of an impact on `mpg` than if weight is disregarded.

Correct

It is both true and sensible that including weight would attenuate the effect of number of cylinders on `mpg`.

points

3.

Consider the `mtcars` data set. Fit a model with `mpg` as the outcome that considers number of cylinders as a factor variable and weight as confounder. Now fit a second model with `mpg` as the outcome model that considers the interaction between number of cylinders (as a factor variable) and weight. Give the P-value for the likelihood ratio test comparing the two models and suggest a model using 0.05 as a type I error rate significance benchmark.

- ☐ The P-value is small (less than 0.05). Thus it is surely true that there is an interaction term in the true model.
- ☐ The P-value is small (less than 0.05). Thus it is surely true that there is no interaction term in the true model.
- ☐ The P-value is small (less than 0.05). So, according to our criterion, we reject, which suggests that the interaction term is not necessary.
- ☒ The P-value is larger than 0.05. So, according to our criterion, we would fail to reject, which suggests that the interaction terms may not be necessary.

Correct

```
1 fit1 <- lm(mpg ~ factor(cyl) + wt, data = mtcars)
2 fit2 <- lm(mpg ~ factor(cyl) * wt, data = mtcars)
3 summary(fit1)$coef
```

```
1 ##           Estimate Std. Error t value Pr(>|t|)
2 ## (Intercept)   33.991     1.8878  18.006 6.257e-17
3 ## factor(cyl)6   -4.256     1.3861   -3.070 4.718e-03
4 ## factor(cyl)8   -6.071     1.6523   -3.674 9.992e-04
5 ## wt            -3.206     0.7539   -4.252 2.130e-04
```

```
1 summary(fit2)$coef
```

```
1 ##           Estimate Std. Error t value Pr(>|t|)
2 ## (Intercept)   39.571     3.194  12.3895 2.058e-12
3 ## factor(cyl)6  -11.162     9.355  -1.1932 2.436e-01
4 ## factor(cyl)8  -15.703     4.839  -3.2448 3.223e-03
5 ## wt            -5.647     1.359  -4.1538 3.128e-04
6 ## factor(cyl)6:wt  2.867     3.117   0.9197 3.662e-01
7 ## factor(cyl)8:wt  3.455     1.627   2.1229 4.344e-02
```

```
1 anova(fit1, fit2)
```

```
1 ## Analysis of Variance Table
2 ##
3 ## Model 1: mpg ~ factor(cyl) + wt
4 ## Model 2: mpg ~ factor(cyl) * wt
5 ##   Res.Df RSS Df Sum of Sq    F Pr(>F)
6 ## 1      28 183
7 ## 2      26 156  2    27.2 2.27  0.12
```

- ☐ The P-value is small (less than 0.05). So, according to our criterion, we reject, which suggests that the interaction term is necessary
- ☐ The P-value is larger than 0.05. So, according to our criterion, we would fail to reject, which suggests that the interaction terms is necessary.

4.

Consider the `mtcars` data set. Fit a model with `mpg` as the outcome that includes number of cylinders as a factor variable and weight included in the model as

```
1 lm(mpg ~ I(wt * 0.5) + factor(cyl), data = mtcars)
```

How is the `wt` coefficient interpreted?

- ☐ The estimated expected change in MPG per half ton increase in weight for the average number of cylinders.
- ☐ The estimated expected change in MPG per one ton increase in weight.
- ☐ The estimated expected change in MPG per half ton increase in weight for for a specific number of cylinders (4, 6, 8).

- ☒ The estimated expected change in MPG per one ton increase in weight for a specific number of cylinders (4, 6, 8).

Correct

- ☐ The estimated expected change in MPG per half ton increase in weight.

5.

Consider the following data set

```
1 x <- c(0.586, 0.166, -0.042, -0.614, 11.72)
2 y <- c(0.549, -0.026, -0.127, -0.751, 1.344)
```

Give the hat diagonal for the most influential point

- ☐ 0.2804
- ☐ 0.2025
- ☐ 0.2287
- ☒ 0.9946

Correct

```
1 influence(lm(y ~ x))$hat
```

```
1 ##      1      2      3      4      5
2 ## 0.2287 0.2438 0.2525 0.2804 0.9946
```

```
1 ## showing how it's actually calculated
2 xm <- cbind(1, x)
3 diag(xm %*% solve(t(xm) %*% xm) %*% t(xm))
```

```
1 ## [1] 0.2287 0.2438 0.2525 0.2804 0.9946
```

6.

Consider the following data set

```
1 x <- c(0.586, 0.166, -0.042, -0.614, 11.72)
2 y <- c(0.549, -0.026, -0.127, -0.751, 1.344)
```

Give the slope dfbeta for the point with the highest hat value.

- ☐ -.00134
- ☐ -0.378
- ☒ -134

Correct

```
1 influence.measures(lm(y ~ x))
```

```
1 ## Influence measures of
2 ## lm(formula = y ~ x) :
3 ##
4 ##      dfb.1_      dfb.x      dffit cov.r   cook.d   hat inf
5 ## 1  1.0621 -3.78e-01   1.0679 0.341 2.93e-01 0.229 *
6 ## 2  0.0675 -2.86e-02   0.0675 2.934 3.39e-03 0.244
7 ## 3 -0.0174 7.92e-03  -0.0174 3.007 2.26e-04 0.253 *
8 ## 4 -1.2496 6.73e-01  -1.2557 0.342 3.91e-01 0.280 *
9 ## 5  0.2043 -1.34e+02 -149.7204 0.107 2.70e+02 0.995 *
```

points

7.

Consider a regression relationship between Y and X with and without adjustment for a third variable Z. Which of the following is true about comparing the regression coefficient between Y and X with and without adjustment for Z.

- ☒ It is possible for the coefficient to reverse sign after adjustment. For example, it can be strongly significant and positive before adjustment and strongly significant and negative after adjustment.

Correct

See lecture 02_03 for various examples.

- ☐ For the the coefficient to change sign, there must be a significant interaction term.
- ☐ Adjusting for another variable can only attenuate the coefficient toward zero. It can't materially change sign.
