

Covariate creation

Jeffrey Leek Johns Hopkins Bloomberg School of Public Health

Two levels of covariate creation

Level 1: From raw data to covariate

WE'VE DISCOVERED YOU ARE THE
HEIR TO AN INCREDIBLE FORTUNE.
PLEASE SUBMIT YOUR NAME,
ADDRESS AND BANK ACCOUNT SO
WE CAN SEND YOU \$\$\$\$\$\$\$.

Level 2: Transforming tidy covariates

```
library(kernlab);data(spam)
spam$capitalAveSq <- spam$capitalAve^2
```

Level 1, Raw data -> covariates

- · Depends heavily on application
- · The balancing act is summarization vs. information loss
- · Examples:
 - Text files: frequency of words, frequency of phrases (Google ngrams), frequency of capital letters.
 - Images: Edges, corners, blobs, ridges (computer vision feature detection))
 - Webpages: Number and type of images, position of elements, colors, videos (A/B Testing)
 - People: Height, weight, hair color, sex, country of origin.
- · The more knowledge of the system you have the better the job you will do.
- · When in doubt, err on the side of more features
- · Can be automated, but use caution!

Level 2, Tidy covariates -> new covariates

- · More necessary for some methods (regression, svms) than for others (classification trees).
- · Should be done only on the training set
- The best approach is through exploratory analysis (plotting/tables)
- New covariates should be added to data frames

Load example data

Common covariates to add, dummy variables

Basic idea - convert factor variables to indicator variables

```
table(training$jobclass)
```

```
1. Industrial 2. Information 1090 1012
```

```
dummies <- dummyVars(wage ~ jobclass,data=training)
head(predict(dummies,newdata=training))</pre>
```

Removing zero covariates

```
nsv <- nearZeroVar(training,saveMetrics=TRUE)
nsv</pre>
```

| | freqRatio | percentUnique | zeroVar | nzv |
|------------|-----------|---------------|---------|-------|
| year | 1.029 | 0.33302 | FALSE | FALSE |
| age | 1.122 | 2.80685 | FALSE | FALSE |
| sex | 0.000 | 0.04757 | TRUE | TRUE |
| maritl | 3.159 | 0.23787 | FALSE | FALSE |
| race | 8.529 | 0.19029 | FALSE | FALSE |
| education | 1.492 | 0.23787 | FALSE | FALSE |
| region | 0.000 | 0.04757 | TRUE | TRUE |
| jobclass | 1.077 | 0.09515 | FALSE | FALSE |
| health | 2.452 | 0.09515 | FALSE | FALSE |
| health_ins | 2.269 | 0.09515 | FALSE | FALSE |
| logwage | 1.198 | 17.26927 | FALSE | FALSE |
| wage | 1.185 | 18.07802 | FALSE | FALSE |
| | | | | |

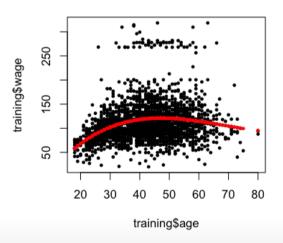

Spline basis

```
library(splines)
bsBasis <- bs(training$age,df=3)
bsBasis</pre>
```

```
3
 [1,] 0.00000 0.0000000 0.000e+00
[2,] 0.23685 0.0253768 9.063e-04
 [3,] 0.44309 0.2436978 4.468e-02
[4,] 0.43081 0.2910904 6.556e-02
[5,] 0.42617 0.1482327 1.719e-02
[6,] 0.41709 0.1331149 1.416e-02
[7,] 0.31823 0.0540390 3.059e-03
[8,] 0.36253 0.3866940 1.375e-01
[9,] 0.44436 0.2275981 3.886e-02
[10,] 0.20449 0.0179375 5.245e-04
[11,] 0.07768 0.3601465 5.566e-01
[12,] 0.13145 0.0066841 1.133e-04
[13,] 0.39290 0.1042387 9.218e-03
[14,] 0.26654 0.0339238 1.439e-03
[15,] 0.20449 0.0179375 5.245e-04
```

Fitting curves with splines

```
lm1 <- lm(wage ~ bsBasis,data=training)
plot(training$age,training$wage,pch=19,cex=0.5)
points(training$age,predict(lm1,newdata=training),col="red",pch=19,cex=0.5)</pre>
```

Splines on the test set

predict(bsBasis,age=testing\$age)

```
3
 [1,] 0.00000 0.0000000 0.000e+00
 [2,1 0.23685 0.0253768 9.063e-04
 [3,] 0.44309 0.2436978 4.468e-02
 [4,] 0.43081 0.2910904 6.556e-02

                                                                                            10/11
[17,1 0.23685 0.0253768 9.063e-04
```

Notes and further reading

- · Level 1 feature creation (raw data to covariates)
 - Science is key. Google "feature extraction for [data type]"
 - Err on overcreation of features
 - In some applications (images, voices) automated feature creation is possible/necessary
 - http://www.cs.nyu.edu/~yann/talks/lecun-ranzato-icml2013.pdf
- Level 2 feature creation (covariates to new covariates)
 - The function *preProcess* in *caret* will handle some preprocessing.
 - Create new covariates if you think they will improve fit
 - Use exploratory analysis on the training set for creating them
 - Be careful about overfitting!
- preprocessing with caret
- If you want to fit spline models, use the *gam* method in the *caret* package which allows smoothing of multiple variables.
- · More on feature creation/data tidying in the Obtaining Data course from the Data Science coարցա
